SBS-MODIFIED ASPHALT ROOFING

CERTAINTEED ROOFING SELF-ADHERED, HOT ASPHALT OR COLD ADHESIVE, AND TORCH APPLIED BASE AND CAP SHEETS

SBS-Modified Asphalt roofing products manufactured with styrenebutadiene-styrene infused asphalt which increases flexibility, especially in low temperatures and comes in three different application types: selfadhered, hot asphalt or cold adhesive, and torch applied.

CertainTeed Corporation, a subsidiary of Saint-Gobain, is a leading North American manufacturer of building materials, which include commercial and residential roofing, vinyl siding, trim, fence, railing and decking, as well as interior building materials including gypsum, ceilings, and insulation.

CertainTeed, and Saint-Gobain, are committed to providing sustainable building products and to limiting our impacts on the environment while doing so. (See our CSR at https://www.saint-gobains-csr-commitments.)

We are also committed to market transparency through third party verified EPDs. In 2016, Saint-Gobain became the group with the most EPDs registered in the International EPD System. This third party verified EPD for Commercial Roofing continues that commitment.

III Environment

According to ISO 14025, ISO 21930:2017 & EN 15804:2012

This declaration is an environmental product declaration (EPD) in accordance with ISO 14025. EPDs rely on Life Cycle Assessment (LCA) to provide information on a number of environmental impacts of products over their life cycle. Exclusions: EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace

tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g. Type 1 certifications, health assessments and declarations, environmental impact assessments, etc. <u>Accuracy of Results</u>: EPDs regularly rely on estimations of impacts, and the level of accuracy in estimation of effect differs for any particular product line and reported impact. <u>Comparability</u>: EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. EPDs from different programs may not be comparable.

SBS-Modified Asphalt Commercial Roofing Self-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

According to ISO 14025

Product Documentation

Product Description

Commercial Roofing systems for low-slope roofing are asphalt based systems with a base sheet and a cap sheet. Roof systems may consist of one or multiple materials depending on the desired performance, warranty, and cost (see Figure 1). CertainTeed offers over forty roll good products, which equates to hundreds of system configurations and

specification options. This EPD is specific to the SBS-Modified Asphalt Commercial Roofing products. SBS-modified asphalt products are manufactured with styrene-butadiene-styrene infused asphalt which increases flexibility, especially in low temperatures. CertainTeed SBS-modified asphalt roofing systems are available in three different application types: self-adhered, hot asphalt or cold adhesive, and torch applied. Additionally, some products listed at "FR" are manufactured with proprietary addititves to increase fire resistance.

Reinforcement mats serve as the structure to asphalt based low-slope roll goods. The mats are impregnated and coated with SBS-modified asphalt and are available with either fiberglass or polyester mats at varying thicknesses. Fiberglass stands up well to heat and tension. Its inherently high melting point affords superior fire resistance when combined with a fire-retardant asphalt

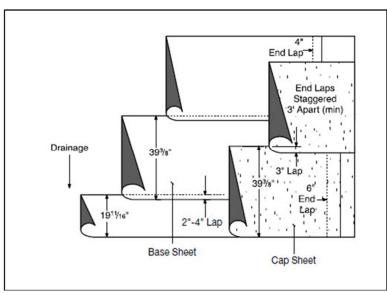

Figure 1: Diagram of Commercial Roofing System

formulation. Fiberglass-reinforced products applied in hot asphalt retain excellent dimensional stability. Additionally, fiberglass has superior tensile strength. When combined with SBS-modified asphalt, the sheets will resist roof movement until the stress absorbed in the mat forces a break. Polyester's predominant benefits are puncture resistance and high elongation. Polyester products handle rooftop foot traffic better. They can also cyclically absorb the strain of building movement and return back to their original dimension.

CertainTeed SBS-Modified Asphalt Commercial Roofing systems are available in three application types: Self-Adhered, Hot Asphalt or Cold Adhesive, and Torch applied. Self-Adhered sheets are faster to train labor and install, have very good adhesion when applied correctly and require no kettle for heating so there are no fumes, and no burn/fire risk. Self-Adhered sheets are yet widely commercially accepted and require a temperature of 50°F or greater. Hot asphalt application is proven, durable, and cost-effective, but are limited by fumes/odor, burn risk, and require the availability of trained labor and appropriate equipment. Cold adhesive application has very good adhesion when applied correctly and requires no kettle and only minimal tools. Cold adhesive application may take up to 60 days to cure and has high fumes/odor. Torch application is faster than hot asphalt or cold adhesive and has very good adhesion when applied correctly. The limitations of the torch application include a burn/fire risk, a risk of improper application, cost of propane needed, and require trained labor.

The SBS-Modified Asphalt Commercial Roofing Base Sheets and Cap Sheets included in this EPD and the underlying Life Cycle Assessment Study are shown in Table 1.

Description of Organization

All CertainTeed SBS-Modified Asphalt Commercial Roofing Products are manufactured at the Little Rock, AR and Shakopee, MN manufacturing locations in the United States.

The Little Rock, AR and Shakopee, MN Roofing manufacturing facilities operate integrated Environmental, Health, and Safety Management Systems that align with the ISO 14001 and ISO 45001 standards.

Little Rock	Shakopee

Product Average EPD

A weighted average of the overall square meter production of each product within the SBS-Modified Asphalt Commercial Roofing product family was used for the results in this EPD. The weighted average of each application type base sheet and cap sheet will be shown as well as a summary of the results for each individual product.

Application

SBS-Modified Asphalt Commercial Roofing systems are intneded for use as low-slope roofing materials on commercial, institutional or residential buildings.

SBS-Modified Asphalt Commercial RoofingSelf-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

System Boundary

The life cycle analysis performed for this EPD is classified as a "cradle-to-gate w/options" study. The system boundary includes raw material supply, manufacture, and transport; the SBS-Modified Asphalt Roofing products manufacture in Little Rock, AR and Shakopee, MN, and packaging; product transportation to building site; installation; and product end-of-life.

	Description of the System Boundary (X=included in LCA: MND=module not declared)															
Pro	Construction Process Product Stage Use Stage			End of Life Stage			Benefits & Loads Beyond System Boundaries									
Raw Material Supply	Transport	Manufacturing	Transport from the gate to the site	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational Energy Use	Operational Water Use	De-construction demolition	Transport	Waste Processing	Disposal	Reuse-Recover- Recycling Potential

According to ISO 14025

Allocation

The Little Rock, AR is the only CertainTeed location that produces all of the SBS-Modified Asphalt Commercial Roofing products, except the Black Diamond Self-Adhered Base Sheet which is manufactured in the Shakopee, MN location. The SBS-Modified Asphalt Commercial Roofing products are not the only products produced at these facilities. Allocation was conducted based on the square meter production of each individual product line as a percentage of the overall square meter production of the facility.

Cut-Off Criteria

The cut-off criteria established for the study include materials, energy, and emissions data. For the purposes of this study, the crtieria are as follows:

- Mass Chemicals with a combined weight less than 1% of the mass of the modeled product may be excluded, providing its environmental relevance is not a concern.
- Human activity factors were not included in the scope of this study.
- Capital equipment factors were not included in the scope of this study.

Data Sources

GaBi version 8.2 software system was used for modeling the life cycle of the SBS-Modified Asphalt Commercial Roofing products. Each background dataset was taken from the GaBi Thinkstep US Ecoinvent, USLCI databases, and Ecoinvent v3.

Data Quality

Wherever secondary data is used, the study adopts critically reviewed data for consistency, precision, and reproducibility to limit uncertainty. The data sources used are complete and representative of North America and Europe (depending on the material source) in terms of the geographic and technological coverage and are less than 10 years old. Any deviations from these initial data quality requirements for secondary data are documented in the report. Overall, the primary data from the manufacturing location is of very high quality, being directly tracked and measured by facility personel. Secondary data sets are of fair-to-good quality.

Period Under Review

Data for this LCA was collected for the 2018 calendar year.

SBS-Modified Asphalt Commercial RoofingSelf-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

According to ISO 14025

Comparability

Comparison of the environmental performance of building and construction products using EPD information shall be based on the product's use and impacts at the building level. In general, EPDs may not be used for comparability purposes when not considered in a building context. Given the PCR ensures products meet the same functional requirements, comparability is permissible provided the information given for such comparison is transparent and the limitations of comparability are explained.

Estimates and Assumptions

Estimates and assumptions are required in life cycle analysis to constrain the project boundary or model when little or not data is available. In this study of SBS-Modified Asphalt Commercial Roofing, estimates or assumptions were made regarding the background dataset for some of the fire retardant materials as specific datasets were not available in the software. Estimates were also used for the transporation distances of some raw materials and packaging material as only the state (OH, AR, GA, TX, etc) was specifically available. The PCR also specifies the assumptions required for the transportation and installation of the products. All estmates and assumptions are appropriately noted in the report.

Technical Information and Scenarios

Manufacturing

The process begins with the roll of fiberglass or polyester mat being mounted and fed into the mat accumulator machine. This machine accumulates the mat in accordion-style so that the machine can continue to run when the mat roll is exhausted and a new one is being mounted. The mat is then fed through the coater machine where the mats are pre-coated with the batch of asphalt and polymers. The mix of asphalt must be heated in order to be applied as a thick liquid. Any films associated with the product being manufactured are applied at this point. The next coat is the filler of granules or sand and any other specified chemicals for the product being made. Cooling the mat is done with through evaporative cooling. Once the mat is cooled and dried, it is wound on to the cardboard core and the finished roll is packaged.

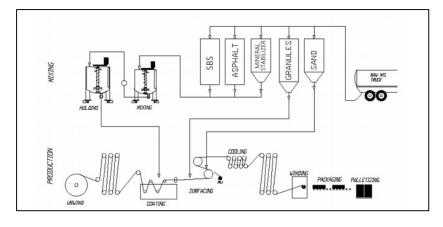

Figure 3: Manufacture of Commercial Roofing Products

SBS-Modified Asphalt Commercial RoofingSelf-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

According to ISO 14025

Packaging

Packaging of the final product after production is included in the life cycle assessment. Per the PCR, the release film used on the SBS-Modified Asphalt Self-Adhered product is to be included as packaging material. Additional packaging material are the cardboard cores the material is wound on, cardboard cartons, plastic bags, tape, and pallets.

Transportation

Final products are transported via truck throughout the United States.

Transport to the Building Site	Unit	Value

According to ISO 14025

Installation

The Asphalt Roofing PCR specifies the equipment and energy consumption requirements for the different installation types used for Commercial Roofing. Depending on the installation, there are additional ancillary material requirements; however, the type and amounts of materials varies widely. In order to remain consistent with industry standards, this study adopts the additional material specifications and VOC emissions detailed in the Asphalt Roofing Manufacturers Association (ARMA) study completed by ThinkStep in 2015 for each of the three installation types. CertainTeed Roofing installation experts, estimate a 15% scrap rate during installation.

Installation into the Building	Unit	SBS-Modified Asphalt (Self-Adhered)	SBS-Modified Asphalt (Hot Asphalt/Cold Adhesive Applied)	SBS-Modified Asphalt (Torch Applied)

According to ISO 14025

Disposal

Deconstruction (module C1) of Commercial Roofing is typically done with manual labor, typically with roofing shovels. At this time there are no recycling scenarios and processing scenarios (module C3) for Commercial Roofing products at the end of the service life. This study assumes the deconstruction and waste processing modules to be burden free. Disposal in a municipal landfill or in commercial incineration facilities is permissible and should be done in accordance with local, provincial, and federal regulations.

LCA Interpretation

Based on the results of the life cycle assessment, the life cycle impacts are strongly driven by the raw materials and installation phases. Within the raw materials, the mats and coatings, and where included, the fire retardant metals, contributed significantly to the environmental impact potentials.

Installation methods vary among the products in the study and installation for specific projects varies widely depending on the project, products used, applications, etc. This makes specific installation data diffcult to obtain. Due to the variable nature of the installation methods and materials, the results for the installation phase of the life cycle should be considered highly uncertain.

The results for individual products within each of the product lines specified in this study vary slightly compared to the averages reported in this EPD, typically due to the coatings and presense of fire retardant metals in the raw material composiiton. The results for the each individual product included in the average are reported in the appendix of this EPD.

Commercial Roofing systems are often comprised of base sheet and cap sheet combinations from different product lines. Environmental impact potentials of specific commercial roofing combinations can be calculated by adding the cradle-to-gate w/options results found in the appendix of a specified base sheet with those of a specified cap sheet.

Additional Environmental Information

Environment and Health During Manufacture

CertainTeed and Saint-Gobain have well-established Environmental, Health, and Safety (EHS) and product stewardship programs, which help to enforce proper evaluation and monitoring of chemicals and raw materials chosen to manufacture products. These programs ensure that all environmental and OSHA requirements are met or exceeded to ensure the health and safety of all employees and contractors.

The Little Rock, AR and Shakopee, MN Roofing manufacturing facilities operate integrated Environmental, Health, and Safety Management Systems that align with the ISO 14001 and ISO 45001 standards.

Environment and Health During Installation

Commerical Roofing products should be installed by trained roofing application professionals according to the installtion method specified for the individual product, as indication in the CertainTeed Application Guide. Appropriate tools and PPE should be used.

SBS-Modified Asphalt Commercial RoofingSelf-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

According to ISO 14025

Extraordinary Effects

Fire

Fire classification of SBS-Modified Asphalt Commercial Roofing is dependent on the products included in the system combination as well as the installation. According to an ICC-ES Evaluation Report for CertainTeed Commercial Roofing, roof covering systems are classified as Class A, B or C roof coverings in accorance with ASTM E108 or UL 790.

Water and Mechanical Destruction

SBS- Modified Asphalt Commerical Roofing products have no known extraordinary effects concerning water, or mechanical destruction.

Table 27: SBS-Modified Asphalt Hot Asphalt/Cold Adhesive Cap Sheets Individual Results

SBS-Modified Asphalt Commercial RoofingSelf-Adhered, Hot Asphalt or Cold Adhesive, and Torch Applied

According to ISO 14025

SBS-Modified Asphalt Torch Applied Base and Cap Sheets							
	Flintlastic Base	Flintlastic FR	Flintlastic GTS				
Cradle-to-Gate w/Opti	20 T	Cap 30 T	FR				
TRACI 2.1 Impact Categories							
Global Warming Potential	kg CO ² eq	3.14E+00	4.32E+00	5.38E+00			
Ozone Depletion Potential	kg CFC-11 eq	2.13E-10	2.71E-10	5.26E-08			
Acidification Potential	kg SO₂ eq	8.64E-03	1.21E-02	1.43E-02			
Eutrophication Potential	kg N eq	6.87E-04	8.81E-04	2.72E-03			
Smog Creation Potential	kg O₃ eq	1.97E-01	2.58E-01	3.05E-01			
Abiotic Depletion Potential	MJ	9.08E+00	1.11E+01	1.39E+01			
	Use of Prim	ary Resources					
Renewable primary energy used as energy carrier	MJ	2.28E+00	6.19E+00	4.23E+00			
Renewable primary resources with energy content used as material	MJ	8.29E-01	8.29E-01	8.29E-01			
Non-renewable primary resources used as an energy carrier	MJ	7.02E+01	8.99E+01	1.05E+02			
Non-renewable primary resources with energy content used as material	MJ	7.78E-04	1.17E-03	1.13E-03			
	Use of Secon	dary Resources					
Secondary materials	kg	0.00E+00	0.00E+00	0.00E+00			
Renewable secondary fuels	MJ	0.00E+00	0.00E+00	0.00E+00			
Non-renewable secondary fuels	MJ	0.00E+00	0.00E+00	0.00E+00			
Recovered energy	MJ	0.00E+00	0.00E+00	0.00E+00			
Use of net fresh water resources	m³	1.25E+00	4.06E+00	2.81E+00			
	Wast	e Flows					
Hazardous waste disposed	kg	9.43E-08	1.23E-07	1.23E-07			
Non-hazardous waste disposed	kg	4.59E+00	5.43E+00	5.72E+00			
High level radioactive waste	kg	1.45E-06	2.94E-06	2.73E-06			
Intermediate and low level	kg	3.46E-05	7.33E-05	5.69E-05
